WSP USA INSPECTION SERVICES DISASTER AWARENESS REPORT

September 28, 2023

Tropical Activity

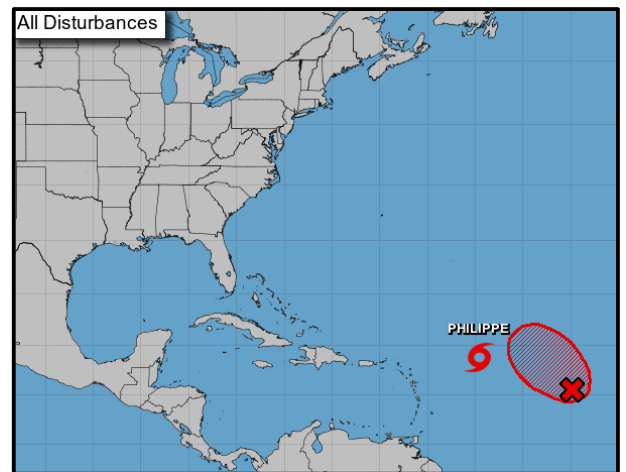

Atlantic – Tropical Storm Philippe

- Tropical Storm Philippe has slowed to a near crawl just over 500 miles east of the northern Caribbean islands.
- Philippe's peak winds are still estimated at 50 mph, but it has reached its expected maximum intensity, according to the National Hurricane Center (NHC).
- Computer forecast models show the system could degenerate into a remnant low as early as Sunday.
- As of Thursday morning, the forecast track and cone of Philippe has the storm drifting to the west-southwest over the next few days, followed by a turn back to the northwest early next week, which could bring Philippe or its remnants near the northern Caribbean islands.
- Philippe could impact the northern Caribbean islands, the U.S. and British Virgin Islands and Puerto Rico with 1 to 3 inches of rain over the weekend and early next week.

Atlantic – Disturbance 1

- The National Hurricane Center continues to monitor a disturbance that is just to the southeast of Tropical Storm Philippe.
- Environmental conditions are expected to remain conducive for development, as long as 91L can stay far enough away from Philippe.
- If so, a tropical depression or tropical storm could form as soon as later Thursday or by Friday while the system moves northwestward across the central tropical Atlantic Ocean.
- Formation chance – 48-hour: High (90%); 7-day: High (90%)
